Unwanted Messages Clog Email Inboxes

ManyMe.com's Free Service Puts Email Users Back in Control

BOSTON, MA – While commercial email services generally do a good job of blocking spam, legitimate senders are still clogging inboxes with relentless marketing messages and unrequested information. At the outset, users likely opted-in to a mailing list, perhaps by agreeing to a privacy policy without reading it (who does?). Over time, however, persistent messages can become unwanted, and because many people don't trust the unsubscribe function, or find it inconvenient, email keeps building in their inboxes, threatening to render them unusable.

ManyMe's free service addresses this issue by creating effective new layers of control over inbox access, while also delivering greater online privacy and security. It does this by making it easy to use substitute email addresses whenever needed for an online registration, or even when disclosing an address in conversation or filling out a paper form. ManyMe automatically remembers each address, and email that passes its unique filtering is forwarded to the user's primary inbox.

Now, instead of using different email accounts for different purposes, email users can have the convenience of managing one inbox served by unlimited addresses, each of which is automatically managed and individually controlled. For example, if an address starts to spread to new senders, ManyMe alerts the user and provides a simple option to control the consequences by pre-emptively blocking any new senders who attempt to use the address; the address may continue to spread, but the user won't care. If the user no longer wants to receive any email on a specific address, the user can simply disable the address, and all email stops immediately – it's like an "instant unsubscribe." In both cases, the user's other ManyMe addresses, and the senders using them, are unaffected.

"ManyMe's free service gives users powerful new controls to protect their primary inbox, while also protecting their privacy and strengthening their online security," said David Hughes, ManyMe's cofounder. "Save your personal address for family and friends, and use ManyMe addresses for everyone else."
